

## Lab Exercise 7– Terraform Variables with Command Line Arguments

### Objective:

Learn how to pass values to Terraform variables using command line arguments.

### Prerequisites:

- Terraform installed on your machine.
- Basic knowledge of Terraform variables.

### Steps:

#### 1. Create a Terraform Directory:

```
mkdir terraform-cli-variables
```

```
cd terraform-cli-variables
```

```
Apple Home ~ .....  
> mkdir terraform-cli-variables  
cd terraform-cli-variables  
  
Apple ~/terraform-cli-variables .....  
> touch README.md ✨
```

#### 2. Create Terraform Configuration Files:

- Create a file named main.tf:

```
# instance.tf
```

```
resource "aws_instance" "example" {  
  ami      = var.ami  
  instance_type = var.instance_type  
}
```

```
Apple ~/terraform-cli-variables .....  
> vim instnace.tf
```

```
Apple ~/terraform-cli-variables .....  
> cat instnace.tf  
iresource "aws_instance" "example" {  
  ami      = var.ami  
  instance_type = var.instance_type  
}
```

- Create a file named variables.tf:

# variables.tf

```
variable "ami" {  
  description = "AMI ID"  
  default    = "ami-08718895af4dfa033"  
}
```

```
variable "instance_type" {  
  description = "EC2 Instance Type"  
  default    = "t2.micro"  
}
```

```
Apple ~/terraform-cli-variables .....
> vim variables.tf

Apple ~/terraform-cli-variables .....
> cat variables.tf

variable "ami" {
  description = "AMI ID"
  default     = "ami-08718895af4dfa033"
}

variable "instance_type" {
  description = "EC2 Instance Type"
  default     = "t2.micro"
}
```

### 3. Use Command Line Arguments:

- Open a terminal and navigate to your Terraform project directory.
- Run the terraform init command:

#### terraform init

```
Apple ~/terraform-cli-variables .....
> terraform init

Initializing the backend...
Initializing provider plugins...
- Finding latest version of hashicorp/aws...
- Installing hashicorp/aws v5.85.0...
- Installed hashicorp/aws v5.85.0 (signed by HashiCorp)
Terraform has created a lock file .terraform.lock.hcl to record the provider
selections it made above. Include this file in your version control repository
so that Terraform can guarantee to make the same selections by default when
you run "terraform init" in the future.

Terraform has been successfully initialized!

You may now begin working with Terraform. Try running "terraform plan" to see
any changes that are required for your infrastructure. All Terraform commands
should now work.

If you ever set or change modules or backend configuration for Terraform,
rerun this command to reinitialize your working directory. If you forget, other
commands will detect it and remind you to do so if necessary.
```

- Run the terraform apply command with command line arguments to set variable values:

**terraform plan -var="ami=ami-0522ab6e1ddcc7055" -var="instance\_type=t3.micro"**

```
❯ terraform plan -var="ami=ami-0522ab6e1ddcc7055" -var="instance_type=t3.micro"
> terraform plan -var="ami=ami-0522ab6e1ddcc7055" -var="instance_type=t3.micro"

+ instance_state              = (known after apply)
+ instance_type               = "t3.micro"
+ ipv6_address_count          = (known after apply)
+ ipv6_addresses              = (known after apply)
+ key_name                    = (known after apply)
+ monitoring                  = (known after apply)
+ outpost_arn                 = (known after apply)
+ password_data               = (known after apply)
+ placement_group             = (known after apply)
+ placement_partition_number  = (known after apply)
+ primary_network_interface_id = (known after apply)
+ private_dns                 = (known after apply)
+ private_ip                  = (known after apply)
+ public_dns                  = (known after apply)
+ public_ip                   = (known after apply)
+ secondary_private_ips       = (known after apply)
+ security_groups              = (known after apply)
+ source_dest_check           = true
+ spot_instance_request_id    = (known after apply)
+ subnet_id                   = (known after apply)
+ tags_all                    = (known after apply)
+ tenancy                     = (known after apply)
+ user_data                   = (known after apply)
+ user_data_base64            = (known after apply)
+ user_data_replace_on_change = false
+ vpc_security_group_ids      = (known after apply)

+ capacity_reservation_specification (known after apply)

+ cpu_options (known after apply)

+ ebs_block_device (known after apply)

+ enclave_options (known after apply)

+ ephemeral_block_device (known after apply)

+ instance_market_options (known after apply)

+ maintenance_options (known after apply)

+ metadata_options (known after apply)

+ network_interface (known after apply)

+ private_dns_name_options (known after apply)

+ root_block_device (known after apply)
}

Plan: 1 to add, 0 to change, 0 to destroy.

Note: You didn't use the -out option to save this plan, so Terraform can't guarantee to take exactly these actions if you run "terraform apply" now.
```

- Adjust the values based on your preferences.

## 4. Test and Verify:

- Observe how the command line arguments dynamically set the variable values during the apply process.
- Access the AWS Management Console or use the AWS CLI to verify the creation of resources in the specified region.

## 5. Clean Up:

After testing, you can clean up resources:

**terraform destroy**

```
aws_instance.example: Destroying... [id=i-0a76016505c4877bb]
aws_instance.example: Still destroying... [id=i-0a76016505c4877bb, 10s elapsed]
aws_instance.example: Still destroying... [id=i-0a76016505c4877bb, 20s elapsed]
aws_instance.example: Still destroying... [id=i-0a76016505c4877bb, 30s elapsed]
aws_instance.example: Still destroying... [id=i-0a76016505c4877bb, 40s elapsed]
aws_instance.example: Still destroying... [id=i-0a76016505c4877bb, 50s elapsed]
aws_instance.example: Still destroying... [id=i-0a76016505c4877bb, 1m0s elapsed]
aws_instance.example: Destruction complete after 1m8s

Destroy complete! Resources: 1 destroyed.
```

Confirm the destruction by typing yes.

## 6. Conclusion:

This lab exercise demonstrates how to use command line arguments to set variable values dynamically during the terraform apply process. It allows you to customize your Terraform deployments without modifying the configuration files directly. Experiment with different variable values and observe how command line arguments impact the infrastructure provisioning process.
