

Lab Exercise 7– Terraform Variables with Command Line Arguments

Objective:

Learn how to pass values to Terraform variables using command line arguments.

Prerequisites:

- Terraform installed on your machine.
- Basic knowledge of Terraform variables.

Steps:

1. Create a Terraform Directory:

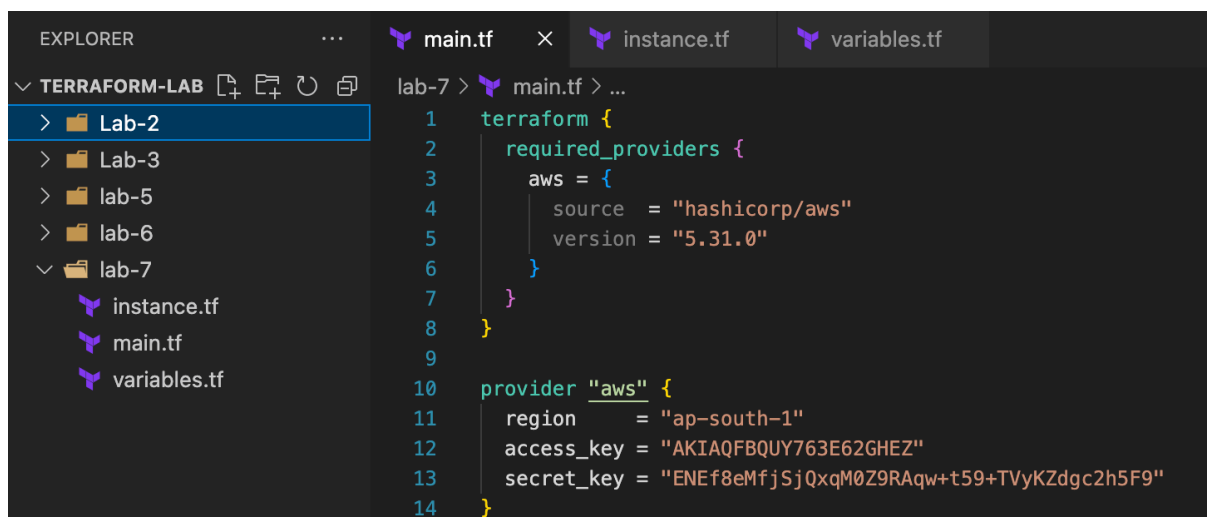

```
mkdir Terraform-Lab
```

```
cd Terraform-Lab
```

```
sai@Sais-Mac ~ % cd /Users/sai/Desktop/Terraform-Lab  
sai@Sais-Mac Terraform-Lab %
```

2. Create Terraform Configuration Files:

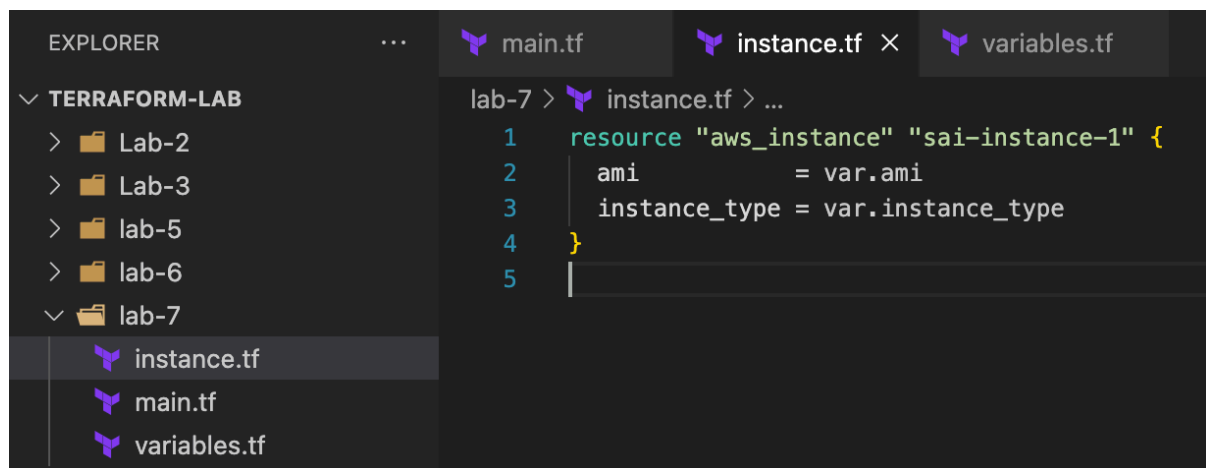

- Create a file named main.tf:

```
lab-7 > main.tf > ...  
1 terraform {  
2     required_providers {  
3         aws = {  
4             source = "hashicorp/aws"  
5             version = "5.31.0"  
6         }  
7     }  
8 }  
9  
10 provider "aws" {  
11     region = "ap-south-1"  
12     access_key = "AKIAQFBQUY763E62GHEZ"  
13     secret_key = "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"  
14 }
```

instance.tf

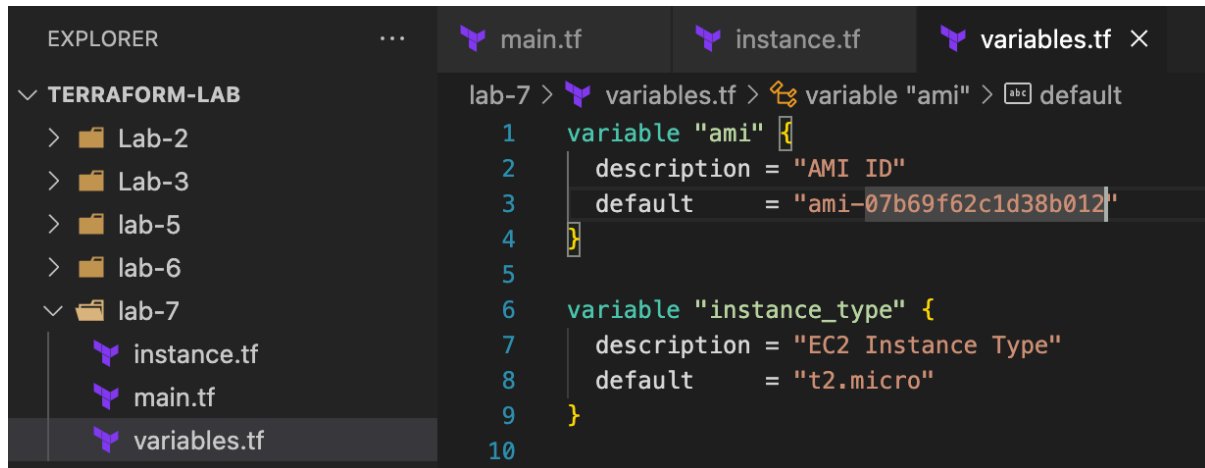

```
resource "aws_instance" "example" {  
  ami      = var.ami  
  instance_type = var.instance_type  
}
```

- Create a file named variables.tf:

variables.tf

```
variable "ami" {  
  description = "AMI ID"  
  default    = "ami-08718895af4dfa033"  
}  
  
variable "instance_type" {  
  description = "EC2 Instance Type"  
  default    = "t2.micro"  
}
```

```
EXPLORER
...
main.tf
instance.tf
variables.tf X

TERRAFORM-LAB
> Lab-2
> Lab-3
> lab-5
> lab-6
> lab-7
  instance.tf
  main.tf
  variables.tf

lab-7 > variables.tf > variable "ami" > default
1 variable "ami" {
2   description = "AMI ID"
3   default     = "ami-07b69f62c1d38b012"
4 }
5
6 variable "instance_type" {
7   description = "EC2 Instance Type"
8   default     = "t2.micro"
9 }
10
```

3. Use Command Line Arguments:

- Open a terminal and navigate to your Terraform project directory.
- Run the terraform init command:

```
terraform init
```

```
[sai@Sais-Mac lab-7 % terraform init
Initializing the backend...
Initializing provider plugins...
- Finding hashicorp/aws versions matching "5.31.0"...
- Installing hashicorp/aws v5.31.0...
- Installed hashicorp/aws v5.31.0 (signed by HashiCorp)
Terraform has created a lock file .terraform.lock.hcl to record the provider
selections it made above. Include this file in your version control repository
so that Terraform can guarantee to make the same selections by default when
you run "terraform init" in the future.

Terraform has been successfully initialized!

You may now begin working with Terraform. Try running "terraform plan" to see
any changes that are required for your infrastructure. All Terraform commands
should now work.

If you ever set or change modules or backend configuration for Terraform,
rerun this command to reinitialize your working directory. If you forget, other
commands will detect it and remind you to do so if necessary.
```

- Run the terraform apply command with command line arguments to set variable values:

```
terraform plan -var="ami=ami-0522ab6e1ddcc7055" -var="instance_type=t3.micro"
```

```
[sai@Sais-Mac lab-7 % terraform plan -var="ami=ami-07b69f62c1d38b012" -var="instance_type=t2.micro"

Terraform used the selected providers to generate the following execution plan. Resource actions are indicated with the following symbols:
+ create

Terraform will perform the following actions:
```

- Adjust the values based on your preferences.

4. Test and Verify:

- Observe how the command line arguments dynamically set the variable values during the apply process.
- Access the AWS Management Console or use the AWS CLI to verify the creation of resources in the specified region.

```
sai@Sais-Mac lab-7 % terraform apply -auto-approve

Terraform used the selected providers to generate the following execution plan. Resource actions are indicated with the following symbols:
+ create

Terraform will perform the following actions:

Plan: 1 to add, 0 to change, 0 to destroy.
aws_instance.sai-instance-1: Creating...
aws_instance.sai-instance-1: Still creating... [10s elapsed]
aws_instance.sai-instance-1: Creation complete after 16s [id=i-058141b9865fa2f16]

Apply complete! Resources: 1 added, 0 changed, 0 destroyed.
```

5. Clean Up:

After testing, you can clean up resources:

terraform destroy

```
sai@Sais-Mac lab-7 % terraform destroy -auto-approve
aws_instance.sai-instance-1: Refreshing state... [id=i-058141b9865fa2f16]

Terraform used the selected providers to generate the following execution plan. Resource actions are indicated with the following symbols:
- destroy

Terraform will perform the following actions:

Plan: 0 to add, 0 to change, 1 to destroy.
aws_instance.sai-instance-1: Destroying... [id=i-058141b9865fa2f16]
aws_instance.sai-instance-1: Still destroying... [id=i-058141b9865fa2f16, 10s elapsed]
aws_instance.sai-instance-1: Still destroying... [id=i-058141b9865fa2f16, 20s elapsed]
aws_instance.sai-instance-1: Still destroying... [id=i-058141b9865fa2f16, 30s elapsed]
aws_instance.sai-instance-1: Still destroying... [id=i-058141b9865fa2f16, 40s elapsed]
aws_instance.sai-instance-1: Still destroying... [id=i-058141b9865fa2f16, 50s elapsed]
aws_instance.sai-instance-1: Still destroying... [id=i-058141b9865fa2f16, 1m0s elapsed]
aws_instance.sai-instance-1: Destruction complete after 1m6s

Destroy complete! Resources: 1 destroyed.
```

Confirm the destruction by typing yes.

6. Conclusion:

This lab exercise demonstrates how to use command line arguments to set variable values dynamically during the terraform apply process. It allows you to customize your Terraform deployments without modifying the configuration files directly. Experiment with different variable values and observe how command line arguments impact the infrastructure provisioning process.
