

Lab Exercise 02

Working With Hosts and Groups

By: Dhruv Jain

Objective: To work with hosts both individually and in groups for streamlined management and deployment across your network infrastructure

Tools required: Ubuntu OS

Prerequisites: You need to have Ansible, and the nodes connected with it installed to proceed with this demo. Refer Demo 1 of Lesson 3.

Steps to be followed:

1. List the hosts present in your host file
2. Create a file on the host
3. Remove the file from the host
4. Create and remove the file on the hosts using the group
5. Update the hosts using the group

Step 1: List the hosts present in your host file

1. Use the following command to list the hosts in your inventory file:

ansible all --list-hosts

```
[do@ip-172-31-8-236 ~]$ ansible all --list-hosts
hosts (2):
    172.31.6.104
    172.31.5.230
```

Note: The host list might change as per your system.

Type your text

Type your text

Step 2: Create a file on the host

Type your text Use the following command to list the contents of the current working directory:

ansible 172.31.6.104 -a "ls"

```
Last login: Thu Apr 10 16:41:51 UTC 2025 on pts/0
[do@ip-172-31-8-236 ~]$ ansible 172.31.6.104 -a "ls"
[WARNING]: Platform linux on host 172.31.6.104 is using the discovered Python interpreter at /usr/bin/python, but future installation of another Python interpreter could change this. See
https://docs.ansible.com/ansible/2.9/reference_appendices/interpreter_discovery.html for more information.
172.31.6.104 | CHANGED | rc=0 >>
file.txt
```

Note: You can create the file on any other host as per your host list.

2. Use the following command to create a file named **file1** on the host:

ansible 172.31.44.85 -a "touch file1"

```
[do@ip-172-31-8-236 ~]$ ansible 172.31.6.104 -a "touch file1"
[WARNING]: Consider using the file module with state=touch rather than running 'touch'. If you need to use command because file is insufficient you can add 'warn: false' to this command ta
sk or set 'command_warnings=False' in ansible.cfg to get rid of this message.
[WARNING]: Platform linux on host 172.31.6.104 is using the discovered Python interpreter at /usr/bin/python, but future installation of another Python interpreter could change this. See
https://docs.ansible.com/ansible/2.9/reference_appendices/interpreter_discovery.html for more information.
172.31.6.104 | CHANGED | rc=0 >>
[do@ip-172-31-8-236 ~]$
```

Step 3: Remove the file from the host

1. Now, run the following command to remove the file from the host:

ansible 172.31.44.85 -a "rm file1"

```
[do@ip-172-31-8-236 ~]$ ansible 172.31.6.104 -a "rm file1"
[WARNING]: Consider using the file module with state=absent rather than running 'rm'. If you need to use command because file is insufficient you can add 'warn: false' to this command ta
sk or set 'command_warnings=False' in ansible.cfg to get rid of this message.
[WARNING]: Platform linux on host 172.31.6.104 is using the discovered Python interpreter at /usr/bin/python, but future installation of another Python interpreter could change this. See
https://docs.ansible.com/ansible/2.9/reference_appendices/interpreter_discovery.html for more information.
172.31.6.104 | CHANGED | rc=0 >>
[do@ip-172-31-8-236 ~]$
```

Step 4: Create and remove the file on the hosts using the group

1. Run the following command to create a new file on both the hosts using the group:

ansible dbbservers -a "touch Ansible_learners"

```
[do@ip-172-31-8-236 ~]$ ansible dbbservers -a "touch Ansible_learners"
[WARNING]: Consider using the file module with state=touch rather than running 'touch'. If you need to use command because file is insufficient you can add 'warn: false' to this command
task or set 'command_warnings=False' in ansible.cfg to get rid of this message.
[WARNING]: Platform linux on host 172.31.5.230 is using the discovered Python interpreter at /usr/bin/python, but future installation of another Python interpreter could change this. See
https://docs.ansible.com/ansible/2.9/reference_appendices/interpreter_discovery.html for more information.
