

Lab Exercise 5–Provisioning an S3 Bucket on AWS

Exercise Steps:

Step 1: Create a New Directory:

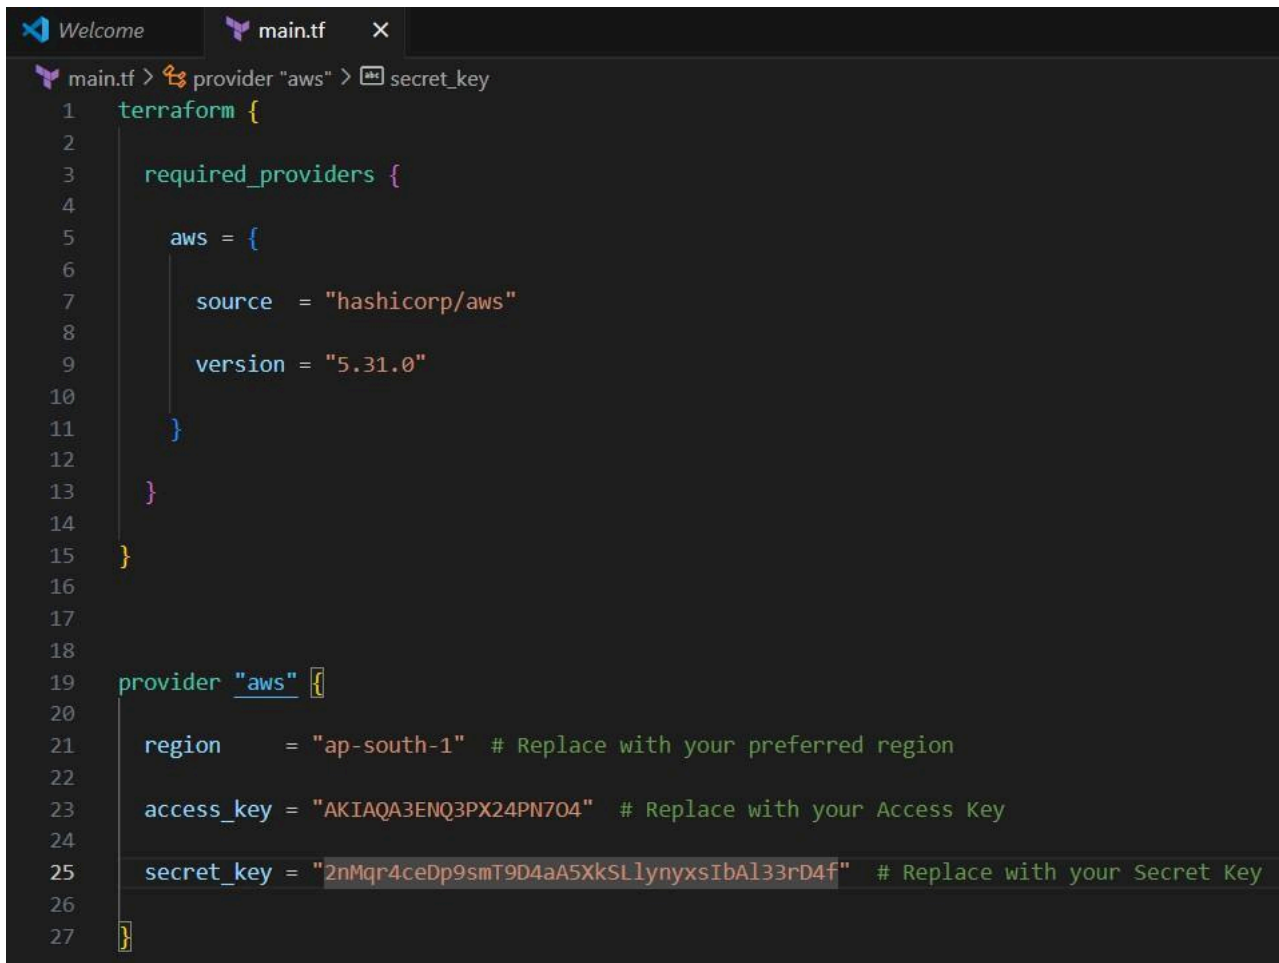

Create a new directory to store your Terraform configuration:

```
mkdir Terraform-S3-Demo cd  
Terraform-S3-Demo
```

Step 2: Create the Terraform Configuration File (main.tf):

Create a file named main.tf with the following content:

```
terraform {  
  required_providers {  
    aws = {  
source = "hashicorp/aws" version =  
      "5.31.0"  
    }  
  }  
}  
  
provider "aws" {  
region = "us-east-1" # Replace with your preferred region access_key =  
  "your IAM access key" # Replace with your Access Key secret_key =  
  "your secret access key" # Replace with your Secret Key  
}
```

```
main.tf > provider "aws" > secret_key
1 terraform {
2
3   required_providers {
4
5     aws = {
6
7       source = "hashicorp/aws"
8
9       version = "5.31.0"
10
11     }
12
13   }
14
15 }
16
17
18
19 provider "aws" {
20
21   region = "ap-south-1" # Replace with your preferred region
22
23   access_key = "AKIAQA3ENQ3PX24PN7O4" # Replace with your Access Key
24
25   secret_key = "2nMqr4ceDp9smT9D4aA5XkSLlynyxsIbAl33rD4f" # Replace with your Secret Key
26
27 }
```

This file sets up the Terraform AWS provider.

Step 3: Create a Terraform Configuration File for the S3 Bucket (s3.tf):

Create another file named s3.tf with the following content:

```
resource "aws_s3_bucket" "my_bucket" {
  bucket = "my-demo-s3-bucket"
tags = {
  Name = "Terraform-S3-Bucket"
}
}
```

This file provisions an S3 bucket with a unique name using a random string suffix.

```
Terraform-S3-Demo > s3.tf > ...  
1  resource "aws_s3_bucket" "my_bucket" {  
2      bucket = "my-demo-s3-bucket"  
3      tags = {  
4          Name = "Terraform-S3-Bucket"  
5      }  
6  }  
7
```

Step 4: Initialize Terraform:

Run the following command to initialize your Terraform working directory:

```
terraform init
```

```
Initializing the backend...  
Initializing provider plugins...  
- Finding hashicorp/aws versions matching "5.31.0"...  
- Installing hashicorp/aws v5.31.0...  
- Installed hashicorp/aws v5.31.0 (signed by HashiCorp)  
Terraform has created a lock file .terraform.lock.hcl to record the provider  
selections it made above. Include this file in your version control repository  
so that Terraform can guarantee to make the same selections by default when  
you run "terraform init" in the future.  
  
Terraform has been successfully initialized!  
  
You may now begin working with Terraform. Try running "terraform plan" to see  
any changes that are required for your infrastructure. All Terraform commands  
should now work.  
  
If you ever set or change modules or backend configuration for Terraform,  
rerun this command to reinitialize your working directory. If you forget, other  
commands will detect it and remind you to do so if necessary.
```

Step 5: Review the Plan:

Preview the changes Terraform will make:

```
terraform plan
```

Review the output to ensure it meets your expectations.

```
+ id = (known after apply)
+ object_lock_enabled = (known after apply)
+ policy = (known after apply)
+ region = (known after apply)
+ request_payer = (known after apply)
+ tags = {
  + "Name" = "Terraform-S3-Bucket"
}
+ tags_all = {
  + "Name" = "Terraform-S3-Bucket"
}
+ website_domain = (known after apply)
+ website_endpoint = (known after apply)

+ cors_rule (known after apply)
+ grant (known after apply)
+ lifecycle_rule (known after apply)
+ logging (known after apply)
+ object_lock_configuration (known after apply)
+ replication_configuration (known after apply)
+ server_side_encryption_configuration (known after apply)
+ versioning (known after apply)
+ website (known after apply)
}

Plan: 1 to add, 0 to change, 0 to destroy.
```

Note: You didn't use the -out option to save this plan, so Terraform can't guarantee to take exactly these actions

Step 6: Apply the Changes:

Create the resources:

```
terraform apply
```

When prompted, type yes to confirm.

```
Terraform used the selected providers to generate the following execution plan. Resource actions are indicated with the following symbols:
+ create

Terraform will perform the following actions:

# aws_s3_bucket.my_bucket will be created
+ resource "aws_s3_bucket" "my_bucket" {
  + acceleration_status      = (known after apply)
  + acl                      = (known after apply)
  + arn                      = (known after apply)
  + bucket                  = "my-demo-s3-bucket-unique123"
  + bucket_domain_name      = (known after apply)
  + bucket_prefix           = (known after apply)
  + bucket_regional_domain_name = (known after apply)
  + force_destroy           = false
  + hosted_zone_id          = (known after apply)
  + id                      = (known after apply)
  + object_lock_enabled      = (known after apply)
  + policy                  = (known after apply)
  + region                  = (known after apply)
  + request_payer            = (known after apply)
  + tags                    = {
    + "Name" = "Terraform-S3-Bucket"
  }
  + tags_all                = {
    + "Name" = "Terraform-S3-Bucket"
  }
  + website_domain           = (known after apply)
  + website_endpoint        = (known after apply)

  + cors_rule (known after apply)

  + grant (known after apply)
```

```
    + grant (known after apply)

    + lifecycle_rule (known after apply)

    + logging (known after apply)

    + object_lock_configuration (known after apply)

    + replication_configuration (known after apply)

    + server_side_encryption_configuration (known after apply)

    + versioning (known after apply)

    + website (known after apply)
  }
}

Plan: 1 to add, 0 to change, 0 to destroy.

Do you want to perform these actions?
  Terraform will perform the actions described above.
  Only 'yes' will be accepted to approve.

Enter a value: yes

aws_s3_bucket.my_bucket: Creating...
aws_s3_bucket.my_bucket: Creation complete after 2s [id=my-demo-s3-bucket-unique123]

Apply complete! Resources: 1 added, 0 changed, 0 destroyed.
```

Step 7: Verify Resources:

1. Log in to your AWS Management Console.
2. Navigate to the S3 dashboard.
3. Verify that the S3 bucket has been created with the specified configuration.

Directory buckets

General purpose buckets (1) Info All AWS Regions

🔄

Copy ARN

Err

Buckets are containers for data stored in S3.

🔍 Find buckets by name

	Name ▲	AWS Region ▼	IAM Access Analyzer
<input type="radio"/>	my-demo-s3-bucket-unique123	Asia Pacific (Mumbai) ap-south-1	View analyzer for ap-south-1

Step 8: Cleanup Resources:

To remove the resources created, run the following command:

```
terraform destroy
```

When prompted, type yes to confirm.

```
    ] -> null
  - type = "CanonicalUser" -> null
    # (1 unchanged attribute hidden)
  }

  - server_side_encryption_configuration {
    - rule {
      - bucket_key_enabled = false -> null

      - apply_server_side_encryption_by_default {
        - sse_algorithm = "AES256" -> null
          # (1 unchanged attribute hidden)
      }
    }
  }

  - versioning {
    - enabled = false -> null
    - mfa_delete = false -> null
  }
}
```

Plan: 0 to add, 0 to change, 1 to destroy.

Do you really want to destroy all resources?

Terraform will destroy all your managed infrastructure, as shown above.
There is no undo. Only 'yes' will be accepted to confirm.

Enter a value: yes

aws_s3_bucket.my_bucket: Destroying... [id=my-demo-s3-bucket-unique123]

aws_s3_bucket.my_bucket: Destruction complete after 1s

Destroy complete! Resources: 1 destroyed.
