Lab Exercise 5-Provisioning an S3 Bucket on AWS

Exercise Steps:

Step 1: Create a New Directory:

Create a new directory to store your Terraform configuration:

```
mkdir Terraform-S3-Demo

cd Terraform-S3-Demo

**

mkdir Terraform-S3-Demo

cd Terraform-S3-Demo

**

//Terraform-S3-Demo

bouch main.tf /*
```

Step 2: Create the Terraform Configuration File (main.tf):

Create a file named main.tf with the following content:

```
terraform {
  required_providers {
   aws = {
    source = "hashicorp/aws"
    version = "5.31.0"
   }
}
```

```
provider "aws" {
         = "us-east-1" # Replace with your preferred region
region
access_key = "your IAM access key" # Replace with your Access Key
secret_key = "your secret access key" # Replace with your Secret Key
          ¢ ⊳ ∼/Terraform-S3-Demo ·····
          > vim main.tf
           ► ~/Terraform-S3-Demo
            cat main.tf
          terraform {
           required_providers {
              source = "hashicorp/aws"
              version = "5.31.0"
          provider "aws" {
region = "ap-south-1"
          access_key = "AKIAR3HUOVVNELXXODNN"
          secret_key = "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"
```

This file sets up the Terraform AWS provider.

Step 3: Create a Terraform Configuration File for the S3 Bucket (s3.tf):

Create another file named s3.tf with the following content:

```
resource "aws_s3_bucket" "my_bucket" {
bucket = "my-demo-s3-bucket"
tags = {
Name = "Terraform-S3-Bucket"
}
```

```
}

d > ~/Terraform-S3-Demo
    vim s3.tf

d > ~/Terraform-S3-Demo
    cat s3.tf

resource "aws_s3_bucket" "my_bucket" {
    bucket = "my-demo-s3-bucket"
    tags = {
        Name = "Terraform-S3-Bucket"
    }
}
```

This file provisions an S3 bucket with a unique name using a random string suffix.

Step 4: Initialize Terraform:

Run the following command to initialize your Terraform working directory:

```
terraform init

**S ~/Terraform-S3-Demo

) terraform init

Initializing the backend...
Initializing provider plugins...
- Finding hashicorp/aws versions matching "5.31.0"...
- Installing hashicorp/aws v5.31.0...
- Installed hashicorp/aws v5.31.0 (signed by HashiCorp)
Terraform has created a lock file .terraform.lock.hol to record the provider selections it made above. Include this file in your version control repository so that Terraform can guarantee to make the same selections by default when you run "terraform init" in the future.

Terraform has been successfully initialized!

You may now begin working with Terraform. Try running "terraform plan" to see any changes that are required for your infrastructure. All Terraform commands should now work.

If you ever set or change modules or backend configuration for Terraform, rerun this command to reinitialize your working directory. If you forget, other commands will detect it and remind you to do so if necessary.
```

Step 5: Review the Plan:

Preview the changes Terraform will make:

```
*** Contact Page 1

** O'Terrafore plan

** O'Terrafore plan

*** Terrafore plan

*** Terrafore plan

*** Terrafore plan

*** Terrafore used the selected providers to generate the following execution plan. Resource actions are indicated with the following symbols:

*** Terrafore will perform the following actions:

*** Mean Contact Page 10 planets of the following execution plan. Resource actions are indicated with the following symbols:

*** Perform Contact Page 10 planets of the following execution plan. Resource actions are indicated with the following symbols:

*** Perform Contact Page 10 planets of the following execution plan. Resource actions are indicated with the following symbols:

*** Perform Contact Page 10 planets of the following execution plan. Resource actions are indicated with the following symbols:

*** Perform Contact Page 10 planets of the following execution plan. Resource actions are indicated with the following symbols:

*** Perform Contact Page 10 planets of the following execution plan. Resource actions are indicated with the following symbols:

*** Perform Contact Page 10 planets of the following execution plan. Resource actions are indicated with the following symbols:

*** Perform Contact Page 10 planets of the following execution plan. Resource actions are indicated with the following symbols:

*** Perform Contact Page 10 planets of the following execution planets of the following symbols:

*** Perform Contact Page 10 planets of the following execution planets of the following symbols:

*** Perform Contact Page 10 planets of the following execution planets of the following symbols:

*** Perform Contact Page 10 planets of the following execution planets of the following symbols:

*** Perform Contact Page 10 planets of the following execution planets of the following symbols:

*** Perform Contact Page 10 planets of the following execution planets of the following symbols:

*** Perform Contact Page 10 planets of the following symbols:

*** Perform Contact Page 10 planets of the follow
```

Review the output to ensure it meets your expectations.

Step 6: Apply the Changes:

Create the resources:

```
≈ ~/Terraform-S3-Demo ······terraform apply
 tags
+ "Name" = "Terraform-S3-Bucket"
        tags_all = {
    + "Name" = "Terraform-S3-Bucket"
      + website_domain = (known after apply)
+ website_endpoint = (known after apply)
      + cors_rule (known after apply)
      + grant (known after apply)
      + lifecycle_rule (known after apply)
      + logging (known after apply)
      + object_lock_configuration (known after apply)
      + replication_configuration (known after apply)
      + server_side_encryption_configuration (known after apply)
      + versioning (known after apply)
      + website (known after apply)
Plan: 1 to add, 0 to change, 0 to destroy.
  you want to perform these actions?
Terraform will perform the actions described above.
Only 'yes' will be accepted to approve.
  Enter a value: yes
 ws_s3_bucket.my_bucket: Creating...
ws_s3_bucket.my_bucket: Creation complete after 2s [id=my-new-unique-s3-bucket-123456]
Apply complete! Resources: 1 added, 0 changed, 0 destroyed.
```

When prompted, type yes to confirm.

Step 7: Verify Resources:

- 1. Log in to your AWS Management Console.
- 2. Navigate to the **S3** dashboard.
- 3. Verify that the S3 bucket has been created with the specified configuration.

Step 8: Cleanup Resources:

To remove the resources created, run the following command:

```
terraform destroy
  tags = {
- "Name" = "Terraform-S3-Bucket"
           } -> null
tags_all = {
    - "Name" = "Terraform-S3-Bucket"
                           = "d4b3a39cf3e438cfde0992498158295ad4ebde14599907bc80cbe1d428a66d5a" -> null
            - apply_server_side_encryption_by_default {
    - sse_algorithm = "AES256" -> null
    # (1 unchanged attribute hidden)
         - versioning {
    - enabled = false -> null
    - mfa_delete = false -> null
   Plan: 0 to add, 0 to change, 1 to destroy.
  Do you really want to destroy all resources?

Terraform will destroy all your managed infrastructure, as shown above.

There is no undo. Only 'yes' will be accepted to confirm.
    Enter a value: yes
  aws_s3_bucket.my_bucket: Destroying... [id=my-new-unique-s3-bucket-123456]
aws_s3_bucket.my_bucket: Destruction complete after 1s
   Destroy complete! Resources: 1 destroyed.
```

When prompted, type yes to confirm.
