# ANSHIKA SRIVASTAVA ROLL NUMBER – R2142220907 SAP ID – 500107049 LAB EXERCISE 3

## Lab Exercise 3-Provisioning an EC2 Instance on AWS

Prerequisites: Terraform Installed: Make sure you have Terraform installed on your machine. Follow the official installation guide if needed.

AWS Credentials: Ensure you have AWS credentials (Access Key ID and Secret Access Key) configured. You can set them up using the AWS CLI or by setting environment variables.

#### **Exercise Steps:**

#### **Step 1: Create a New Directory:**

Create a new directory for your Terraform configuration:

```
mkdir aws-terraform-demo

cd aws-terraform-demo

ansni@HP MINGW04 /d
$ cd 'SPCM Lab'

anshi@HP MINGW64 /d/SPCM Lab
$ mkdir aws-terraform-demo

anshi@HP MINGW64 /d/SPCM Lab
$ cd aws-terraform-demo
```

**Step 2: Create Terraform Configuration File (main.tf):** 

Create a file named main.tf with the following content:

```
terraform {
  required_providers {
   aws = {
    source = "hashicorp/aws"
  }
}
```

```
version = "5.31.0"
}
}
```

```
provider "aws" {
 region = "ap-south-1"
 access_key = "your IAM access key"
secret key = "your secret access key"
}
                    main.tf
  EXPLORER

✓ AWS-TERRAFORM-DEMO

                     main.tf > 😝 provider "aws" > 🔤 secret_key
                           terraform {
 main.tf
                             required providers {
                               aws = {
                                 source = "hashicorp/aws"
                                 version = "5.83.0"
                      10 provider <u>"aws"</u> {
                             # Configuration options
                               region = "eu-north-1"
                             access_key = "AKIAUIALHVPT7DUK6YGA"
                             secret_key = "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"
                      14
```

This script defines an AWS provider and provisions an EC2 instance.

#### **Step 3: Initialize Terraform:**

Run the following command to initialize your Terraform working directory:

```
terraform init
PS D:\SPCM Lab\aws-terraform-demo> terraform init
Initializing the backend...
Initializing provider plugins...
- Finding hashicorp/aws versions matching "5.83.0"...
- Installing hashicorp/aws v5.83.0...
  Installed hashicorp/aws v5.83.0 (signed by HashiCorp)
Terraform has created a lock file .terraform.lock.hcl to record the provider
selections it made above. Include this file in your version control repository
so that Terraform can guarantee to make the same selections by default when
you run "terraform init" in the future.
Terraform has been successfully initialized!
You may now begin working with Terraform. Try running "terraform plan" to see any changes that are required for your infrastructure. All Terraform commands
should now work.
If you ever set or change modules or backend configuration for Terraform,
rerun this command to reinitialize your working directory. If you forget, other
commands will detect it and remind you to do so if necessary.
PS D:\SPCM Lab\aws-terraform-demo>
```

### Step 4: Create Terraform Configuration File for EC2 instance (instance.tf):

Create a file named instance.tf with the following content:

```
resource "aws_instance" "My-instance" {
    instance_type = "t3.micro"
    ami = " ami-075449515af5dfod1"
    count = 1
    tags = {
        Name = "UPES-EC2-Instnace"
    }
}
```

#### Step 5: Review Plan:

Run the following command to see what Terraform will do:

```
terraform plan
 PS D:\SPCM Lab\aws-terraform-demo> terraform plan
 Terraform used the selected providers to generate the following execution plan. Resource actions are indicated
 with the following symbols:
   + create
 Terraform will perform the following actions:
   # aws_instance.My-instance[0] will be created
   + resource "aws_instance" "My-instance" {
                                             = " ami-075449515af5df0d1"
       + ami
       + arn
                                             = (known after apply)
       + associate_public_ip_address
                                             = (known after apply)
       + availability_zone
                                             = (known after apply)
       + cpu_core_count
                                             = (known after apply)
       + cpu_threads_per_core
                                             = (known after apply)
                                             = (known after apply)
       + disable_api_stop
       + disable_api_termination
                                             = (known after apply)
       + ebs_optimized
                                             = (known after apply)
       + enable_primary_ipv6
                                             = (known after apply)
       + get_password_data
                                             = false
```

Review the plan to ensure it aligns with your expectations.

#### **Step 6: Apply Changes:**

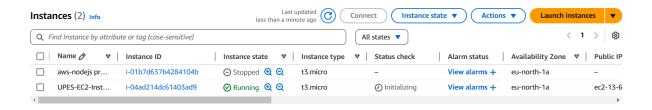

Apply the changes to create the AWS resources:

```
terraform apply
PS D:\SPCM Lab\aws-terraform-demo> terraform apply
Terraform used the selected providers to generate the following execution plan. Resource actions are indicated
with the following symbols:
  + create
Terraform will perform the following actions:
  # aws_instance.My-instance[0] will be created
  + resource "aws_instance" "My-instance" {
                                             = " ami-075449515af5df0d1"
      + ami
      + arn
+ associate_public_ip_address
                                             = (known after apply)
                                             = (known after apply)
                                             = (known after apply)
                                            = (known after apply)
      + cpu_core_count
                                             = (known after apply)
      + cpu_threads_per_core
      + disable_api_stop
                                            = (known after apply)
 Plan: 1 to add, 0 to change, 0 to destroy.
Do you want to perform these actions?
   Terraform will perform the actions described above.
  Only 'yes' will be accepted to approve.
  Enter a value: yes
 aws_instance.My-instance[0]: Creating...
 aws_instance.My-instance[0]: Still creating... [10s elapsed]
 aws_instance.My-instance[0]: Creation complete after 16s [id=i-04ad214dc61403ad9]
 Apply complete! Resources: 1 added, 0 changed, 0 destroyed.
PS D:\SPCM Lab\aws-terraform-demo>
```

Type yes when prompted.

#### **Step 7: Verify Resources:**

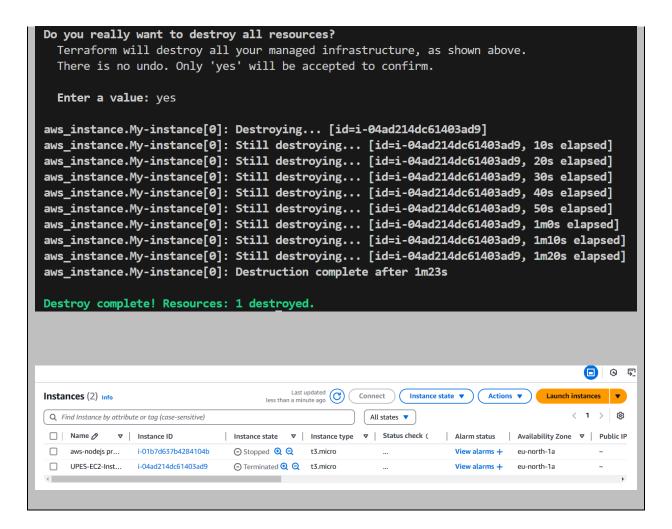

After the terraform apply command completes, log in to your AWS Management Console and navigate to the EC2 dashboard. Verify that the EC2 instance has been created.

#### **Step 8: Cleanup Resources:**

When you are done experimenting, run the following command to destroy the created resources:

```
terraform destroy
PS D:\SPCM Lab\aws-terraform-demo> terraform destroy
aws_instance.My-instance[0]: Refreshing state... [id=i-04ad214dc61403ad9]
 Terraform used the selected providers to generate the following execution plan. Resource actions are indicated
with the following symbols:
   - destroy
Terraform will perform the following actions:
  # aws_instance.My-instance[0] will be destroyed
    resource "aws_instance" "My-instance" {
                                             = "ami-075449515af5df0d1" -> null
      - ami
                                             = "arn:aws:ec2:eu-north-1:292081347559:instance/i-04ad214dc61403ad9
      associate_public_ip_address
                                            = true -> null
      availability_zone
                                            = "eu-north-1a" -> null
      - cpu_core_count
      cpu_threads_per_core
```

Type yes when prompted.

#### Notes:

Customize the instance.tf file to provision different AWS resources.

Explore the Terraform AWS provider documentation for additional AWS resources and configuration options.

Always be cautious when running terraform destroy to avoid accidental resource deletion.

This exercise provides a basic introduction to using Terraform with the AWS provider. Feel free to explore more complex Terraform configurations and resources based on your needs.
